

Supplementary Material

Fig. S1 - Principal Component Analysis (PCA) of relations between the sites and soil physical attributes. For analysis: soil humidity (M) and soil bulk density (D) and the soil texture as sand, clay and silt contents, and penetration resistance (PR).

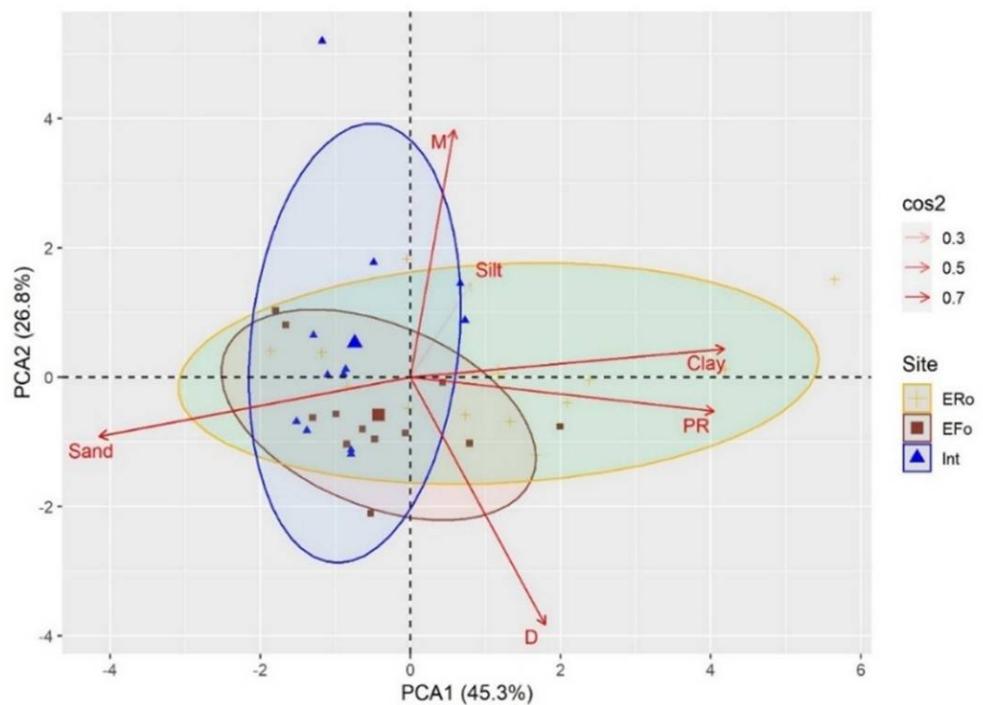

Fig. S2 - Principal Component Analysis (PCA) of relations between the sites and soil chemical attributes. For analysis: available C, P, K, Al, S, Ca, Na, Mg, Fe, Cu, B, Mn, Zn, exchangeable acidity (HAI), pH (H_2O), organic matter (OM), sum of exchangeable bases (SB), aluminum saturation (m), Cation Exchange Capacity (CTC), base saturation (V), sodium saturation index (ISNa), and effective cation exchange capacity (CTC1).

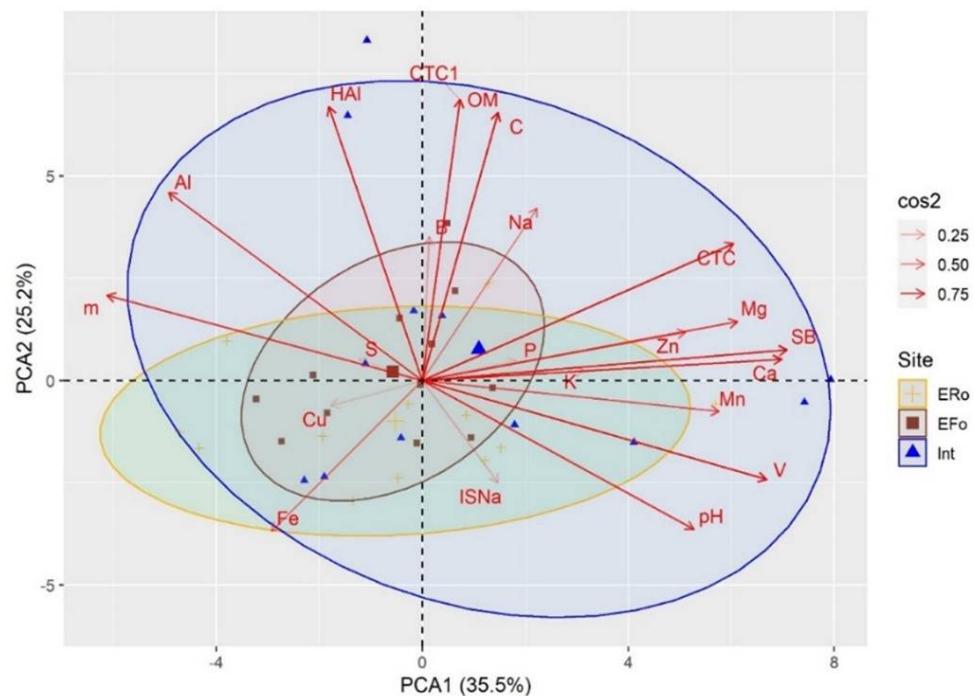

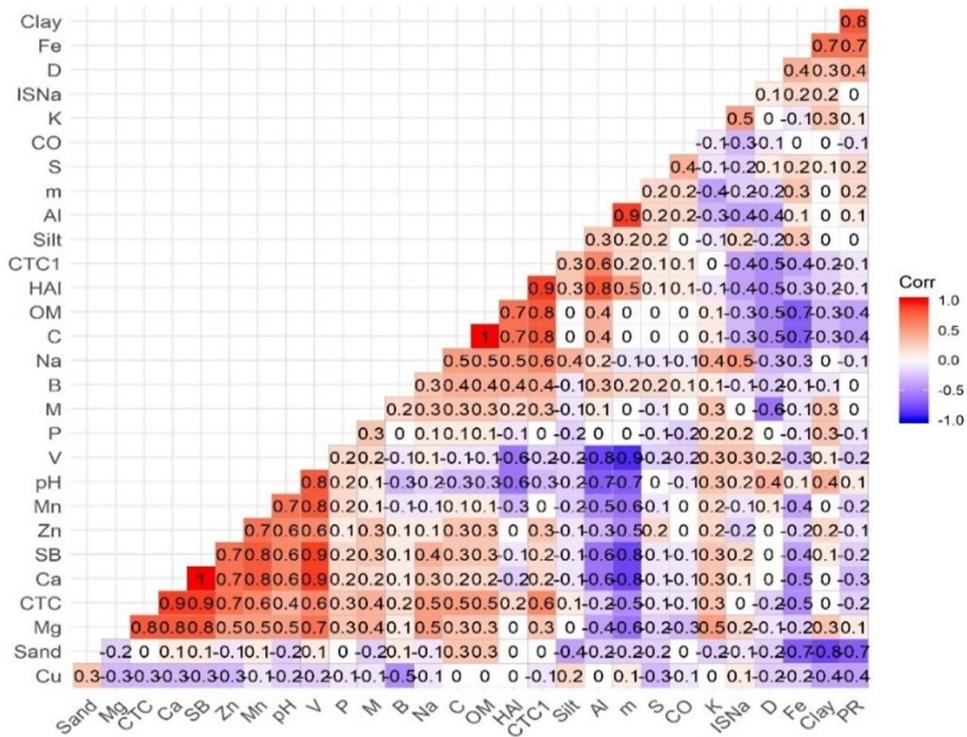

Fig. S3 - Pearson correlation among all individual variables measured in 36 plots in the three study areas. For analysis: available C, P, K, Al, S, Ca, Na, Mg, Fe, Cu, B, Mn, Zn, exchangeable acidity (HAI), pH (H_2O), organic matter (OM), sum of exchangeable bases (SB), aluminum saturation (m), Cation Exchange Capacity (CTC), base saturation (V), sodium saturation index (ISNa), effective cation exchange capacity (CTC1), and canopy openness (CO).

Tab. S1 - The phytosociology analysis of the three sites. Number of individuals (NI), Relative dominance (RDo), Relative frequency (RF) and relative density (RD). Importance value (IV) of species is also indicated for the three study areas in percentage (%).
