

## Supplementary Material

**Fig. S1** - SE images of the  $^{13}\text{C}$ -nPS showing their spherical shape and their homogeneous distribution.

**Tab. S1** - Detailed data on dry weight,  $\delta^{13}\text{C}$ , atom% and the amount of  $^{13}\text{C}$  (g) in each tissue of each replicate plant.  $^{13}\text{C}$  in samples was expressed as  $\delta^{13}\text{C}$  value (‰) relative to the Pee Dee Belemnite (PDB) standard. The isotopic ratio ( $^{13}\text{C}/^{12}\text{C}$ ) of each sample  $R_{\text{sample}}$  can be calculated by the following equation:

$$R_{\text{sample}} = \left( \frac{\delta^{13}\text{C}}{1000} + 1 \right) \times R_{\text{PDB}}$$

$R_{\text{PDB}} = 0.011237$  is the isotopic ratio of  $^{13}\text{C}/^{12}\text{C}$  in PDB. Atom % (% of  $^{13}\text{C}$  in total carbon atoms) of the sample was then calculated as follows:

$$\text{atom \%} = \left( \frac{R_{\text{sample}}}{R_{\text{sample}} + 1} \right) \times 100 \%$$

The amount of  $^{13}\text{C}$  in a given tissue was calculated by multiplying atom% by the C content in (%) and the dry weight. Type: (C) control; (T) treatment; (R1): part of the main root incubated; (R2): part of the main root not immersed; (R3): remaining part of the root system in the soil; (S): Stem; (L): leaves (for details see Fig. 1).
