Implications of ecotourism development in protected areas: a study from Rema-Kalenga Wildlife Sanctuary, Bangladesh

Rana MP (1), Sohel MSI (1), Mukul SA (2), Chowdhury MSH (3), Akhter S (1), Koike M (3)

This article is based on visitors profile study of protected area based tourist spots of Rema-Kalenga Wildlife Sanctuary (RKWS), Bangladesh to ascertain the potential of ecotourism. Study findings shows that 69% male constitute the visitors group while the maximum number of visitors was found in the age of below 30 years. Most of the visitors were literate and among them 43% visitors were student. Most (53%) of visitors preferred to get recreation in holidays as they were employed. Visitors were highly preferred to come with friends group. About 92% respondents showed positive mind to come here in future while 89% respondents view that park has tourism potential. Most of the respondents reported the presence of wildlife (48%) most noted allowable by plant diversity and tribal community as recreational. From $\chi^2$ test it is found that highly significance association present between tourism potentiality of the wildlife sanctuary and some demographic variable like income of tourists ($\chi^2 = 49.138$, $p < 0.000$), visiting pattern ($\chi^2 = 19.344$, $p < 0.000$), education of tourists ($\chi^2 = 50.226$, $p < 0.000$), travelling distance (Km - $\chi^2 = 11.427$, $p < 0.022$), duration of staying ($\chi^2 = 12.867$, $p < 0.002$), frequency of visit ($\chi^2 = 8.456$, $p < 0.015$), visiting time ($\chi^2 = 6.530$, $p < 0.011$), problem in the study area ($\chi^2 = 14.962$, $p < 0.021$), occupation of tourists ($\chi^2 = 8.848$, $p < 0.031$). If the problems addressed by the visitors were solved, RKWS would be a bright place of eco-tourism in Bangladesh.

Keywords: Ecotourism, Protected area, Tourism potential, Visitors, Bangladesh

Introduction

Worldwide, many countries and regions rich in biodiversity and poor in economy have been vigorously promoting ecotourism as a conservation tool in their protected areas (PAs) since the 1990s (He et al. 2008). PAs now cover more than 12% of the world’s land area. These PAs are on the front line in the campaign to conserve biodiversity as well as to promote eco-tourism on the planet Earth (Chape et al. 2003, Hales 1989). Tourism use of PAs basically involves the travel for the discovery and learning about wild environments. The importance of nature in attracting tourists is significant and stated that nature and cultural heritage represent a competitive advantage for many areas, for different kinds of protected areas (Williams 1992), a chance to see wildlife and undisturbed nature is rated as very important reason for visits to PAs (Goodwin 1996). PAs are becoming more popular destinations for wildlife tourists of national and international origin. Besides this, economic benefits from tourism are observed in different PAs. Protected area based eco-tourism that can give rise to economic benefits to local communities as well as to the nation (Hales 1989, Goodwin 1996, Wells et al. 1992, Western & Wright 1994, Hannah 1992, Ghimire & Pimbert 1997, GOI 1994, Fiallo & Jacobson 1995, Ite 1996, Mehta & Kellert 1998, Rao 1996, Lindberg & Enriquez 1994, Walpole & Goodwin 2000, Walpole et al. 2001). Nature or forest based tourism is a key category of eco-tourism, one of the fastest growing sectors of the world (Landell-Mills & Porras 2002). However in Bangladesh this promising sector is poorly utilized. From a source it has been found that, less than 10000 foreign visitors entered in 1992, domestic tourism on the other hand appears to be a strongly flourishing sector of the market (Vantomme et al. 2002).

Protected areas have played significant roles as tourist attractions in many countries...

since their establishment (Butler & Boyd 2000). PAs with their landscapes, flora and fauna as well as their cultural elements form attractions for tourists (Ceballos-Lascurain 1993). Another thing is that eco-tourism continues to become a management strategy for protected areas. There are numerous opportunities for ecotourism in protected areas. Such opportunities are revenue generation (i.e., user fees, entrance fees and donations), employment creation, justification for protected areas, healthier economies, environmental education, and improved conservation efforts (Borrie et al. 1998, Drumm & Moore 2005). Presently, there are 19 notified protected areas (i.e., 11 national parks, seven wildlife sanctuaries and one game reserve) in Bangladesh (NSP 2006). Compared to other regions of the world, this figure is still very poor. The PAs of Bangladesh cover nearly 1.7% of the total landmass of the country, which is the second lowest per capita area under PAs in any country (Sharma et al. 2005). As the tourism industry is quickly becoming the most profitable industry in developing countries, Government of Bangladesh should give emphasis to increase protected areas for ecotourism development. As PAs has become a new tool to promote environmentally and culturally friendly tourism, but still now a little reliable published information is available regarding the tourism potentialities of PAs of Bangladesh. Taking this view a head the present study was conducted in Rema-Kalenga Wildlife Sanctuary of Bangladesh to assess the recreation potential as a protected area, which will help the planner to provide an effective plan for its management and improvement. Also influence to increase protected areas for ecotourism development in Bangladesh.

Methodology

Site profile

Rema-Kalenga Wildlife Sanctuary (RKWS) is located approximately 130 km east-northeast of Dhaka and 80 km south-southeast of Sylhet in Chunarughat Thana, a sub-district of Habiganj District, Sylhet. The sanctuary is bounded by Tripura State (India) to the south and east, and Kalenga Forest Range to the north and west. Geographically, the area lies between 24°06'-24°14' N latitude and 91°34'-91°41' E longitude (Fig. 1). The area falls under the Sylhet Hills zones (Nishat et al. 2002), and the administrative area is known as the Rema-Kalenga Forest Range. Table one describes the main features of the Rema-Kalenga Wildlife Sanctuary.

Data collection and analysis

To collect data and information, an opinion pull was conducted in the study areas. This was because most of recreation seekers were willing to pass their spare time in these eco-tourism spots. Visitor’s survey method was conducted for valuation of outdoor recreation. A total of 150 respondents were interviewed representing different socio-economic and occupational groups. The selection of respondents was done randomly to avoid serious biasness. The respondents were interviewed with a semi-structured questionnaires designed for this purpose. The aim of survey was to gather information related to demography of visitors as the major stakeholder (e.g., age, education and occupation), visits to the park (e.g., frequency, season, time, purpose, form of visit, willingness to further visit), tourism potential of the park and problems faced by the visitors during visits. Descriptive statistics were derived to summarise the property of the dataset, while analytical methods (correlation and chi-squared test) were used to analyse the data and test for differences (at 95% level of significance). Analysis was conducted using SPSS ver 10.0 (Statistical Package for the Social Sciences). Here, chi-squared test explains the relationship between tourism potential with other demographic variable.

Results

Demographic characteristics of visitors

The total visitors of the surveyed area were 150, of which 103(68.7%) were male and the

rest 47 (31.3%) were female. Among the visitors, 60% male said that the RKWS is tourism potential (Tab. 3). While 2.66% females view were negative. Majority of the visitors belong to younger groups (<30 years), which is about 84%. Older age groups (>30 years) represents only 16% (Fig. 2).

Study shows that most (89.7%) of the visitors are literate. Among the visitors, education status of 17.3% visitors are the primary and secondary level and 28.7% are the higher secondary level (Fig. 3). Among the respondents, above higher secondary (Graduate, PhD) level visitors (42.66%) and more than twice (13.3%) told that the RKWS is recreation potential (Tab. 3).

Findings revealed that 78.7% visitors are employed. Students represent the highest number of visitors (42.7%) followed by for the second time (36%) and again for third time (24%). Among the different income group medium family followed by rich family (42%) and more than twice (13.3%). 39.33% first time followed by for the second time (24%) told that the RKWS has tourism potential (Tab. 3). Maximum 40.66% group of friends told that the RKWS has tourism potential (Tab. 3).

Economics of the visitors

Maximum visitors (56.7%) are come from medium family followed by rich family (24%). Among the different income group highest (54.66%) visitors of medium family opined that the site is recreation potential (Tab. 3). Most of the visitors in the study area are visiting in a group with friends (42%) followed by family groups (25.3%). Couple category represents the lowest number of visitors (12.7% - Fig. 4). Maximum 40.66% group of friends told that the RKWS has tourism potential (Tab. 3).

Duration, visiting time, frequency of visit and traveling distance

Study revealed that 52.7% visitors preferred to pass their spare time during holidays and the remaining 47.3% visitors desired to enjoy the RKWS other than holidays (Tab. 2). 50% visitors those pass their time during holidays told that the RKWS is recreation potential (Tab. 3). It is found that most of the visitors (44.7%) visited RKWS for the first time followed by for the second time (42%) and more than twice (13.3%). 39.33% of the visitors those who came second time told that the site is tourism potential. The study indicate that most of the visitors (77.3%) stay at the RKWS for (2-5) h followed by less than 2 h (13.3%) and more than 5 h (9.3%). Among the respondents those spent (2-5) h, 71.33% told that the RKWS is recreation potential (Tab. 3). Findings showed that 24% visitors come from a distances range (50-75) Km followed by 100+ Km distances (23.3%), <25 Km distances (20.7%), (25-50) Km distances (20.7%) and 75-100 Km distances (11.3% - Fig. 6). Highest 21.33% visitors who came from 100+ Km distances told that the site has ecotourism potentiality (Tab. 3).

Problems identified by the visitors

According to the visitors, the remarkable problems are insufficient toilets, accommo-

Tourism potential

Of the surveyed respondents, 88.7% were of the view that their visit experience at RKWS was recreational and only 11.3% respondents stated it was not so. The respondents, to whom visit to the RKWS appeared recreational, were asked specific question on what component provided them recreation most. In response to it, most of the respondents reported the presence of wildlife (48%) most notable followed by plant diversity (36%) and tribal community (16%) as recreational (Fig. 8).

Another specific question was asked whether the respondents would like to make recurrent visit to the site in future. A high proportion of respondents (92%), after the visit experience at RKWS expressed their willingness to make further visits while only 8% respondents denied coming again.

Relationship between demographic variable and tourism potentiality of the park

From chi-square test it is found that highly significance association present between tourism potentiality of the wildlife sanctuary and some demographic variable like income of tourists (chi-square = 49.138, \( p < 0.000 \)), visiting pattern (chi-square = 19.344, \( p < 0.000 \)), education of tourists (chi-square
people belong to the medium class for whose protected area is an important area for recreation. Generally we know mass gathering of people is seen in any recreational areas during holidays. This is not exceptional in context of our country. If RKWS it reflects that more visit followed less recreational demand and vice versa. Most of the recreationalist wished to stay inside the park for two to five hours only. Most of the visitors come from other district and also from the city area. The RKWS comprises the remaining natural forests, and the plantations raised earlier by converting high forests of great biodiversity value. Large deciduous trees are mixed with evergreen smaller trees and bamboos. The top canopy includes Artocarpus chaplasha, Dipterocarpus turbinatus, Elaeocarpus floribundus, Dillenia pentagyna, Castanopsis tribuloides, etc. A total of 167 species (mammals, birds, reptiles and amphibians) including forest-dwelling and wetland-associated species were documented. Besides this Tipra polli, tea garden creates more interest for visitors (Ali 2008). The field observation and the study on the visitors revealed that recreational facilities like wildlife, natural beauty and tribal community attract the visitors. This finding corresponds with the opinion of Ceballos-Lascurain (1993) that green spaces with their landscapes, flora and fauna as well as their cultural elements form attractions for tourists. Besides the potentialities the respondents raised the issue of some problems they faced in the park. The similar trend of problems was found in the visitor survey in Si-takunda Botanical Garden and Eco-park of Bangladesh by Nath & Alauddin (2006), where lack of security measures was the most important issue as visitor’s sometimes fell victim to nuggling in remote and desolate corners of the WS. Okaka (2007) reported the relatively lower number of visitors to some protected areas of Uganda due to inadequate security situation. Studies on people participation in outdoor recreation found that it revitalizes human spirit, restores people’s initiatives of life, produces feeling of well-being, satisfaction, creativeness and physical conditions (Wenger 1984, Brockman & Merriam 1979, Douglas 1982, Torkildsen 1992, Jashimuddin & Alamgir 2005). So, from this study it can be concluded that RKWS might be a potential outdoor recreation area.

Conclusion and recommendations for planners and managers

Tourism in RKWS is a very new development. In order to develop this sector further, separate management plan and an action plan for tourism should be developed. Numerous people come to RKWS to see forests, wild life, and natural beauty and to visit the surrounding attractions. The park has a good potentiality for eco-tourism even though it does not offer any lodging facilities. Bangladesh government can create opportunities to develop the tourist industry (ecotourism) based on protected areas. Tourism and protected areas: attitudes of rural residents towards conservation and Machalilla national park, Ecuador. Environmental Conservation

Discussion

Establishment of protected areas (PAs) has been the most widely accepted means of biodiversity conservation so far, supported by national and international agencies (Hales 1989, Sekhar 2003, Walpole et al. 2001). Tourism use of PAs basically involves the travel for the discovery and learning about wild environments. Tourism is viewed in many industrial nations as an environmentally friendly way to revitalize distressed rural communities and economies. A similar view is gaining momentum in developing countries like Bangladesh where PAs are becoming more popular destinations for wildlife tourists of national and international origin.

Study findings revealed that the visitors in the RKWS are varied with age, sex, education and occupation. In general male visitors are higher than female visitors in outdoor recreation (Ahmed 1993). Youth visits are more interested in outdoor recreation (Ahmed 1993). In the present study it was found that the young energetic males are very much willing to visit the park. The lack of safety, deficiency in proper facilities and the backwardness of women in our society might have discouraged them to come for recreation in this wildlife sanctuary. Educated people are more interested to visit the RKWS. The results also revealed that education can play a vital role in determining the demand for recreational activities at the RKWS. Considering occupation students can play the leading role to gear up the recreational activities in the RKWS. Ahmed (1993) also repeated that students are the major groups of outdoor recreation. Another work done by Ahmed & Rahman (1997) also showed that participation of outdoor recreation increase with increasing educational level but decreases after higher secondary level. The results also predict that RKWS might be a good recreational area for enjoying with family members and group of friends. Visitors were also asked to find out amount of money they spend or willing to pay for the recreation they get into the RKWS. From economic point of view the study area is major source of recreation for medium class people. Bangladesh is a developing country and a large percentage of
